

Entity resolution changes the certainty, not the effect

The two node-identity schemes return the same standardized effect size ($r = .114$ vs $.121$) and p values twenty orders of magnitude apart.

Naive scheme — raw affiliation strings as nodes

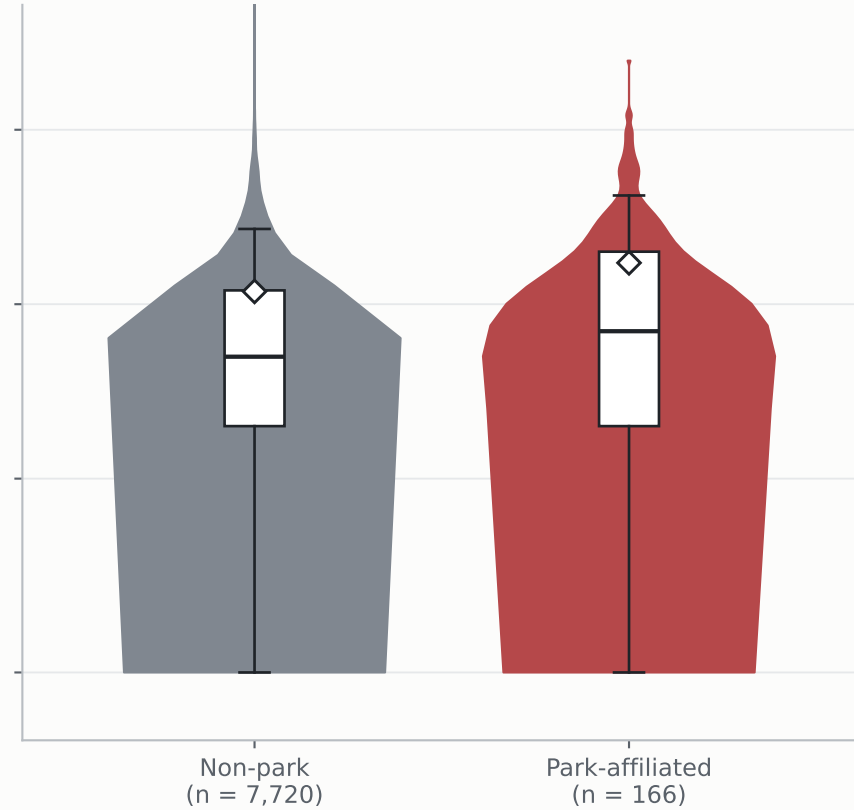

N = 69,455 nodes

Mann-Whitney $p = 8.9 \times 10^{-23}$
rank-biserial $r = 0.114$ · CLES = 0.557
mean 4.69 (park) vs 3.56 (non-park) · median 3 vs 2

Entity-resolved scheme — standardized institutions

N = 7,886 nodes

Mann-Whitney $p = .0073$
rank-biserial $r = 0.121$ · CLES = 0.561
mean 17.26 (park) vs 11.84 (non-park) · median 7 vs 5
